The **TSi VRP series** is designed to provide precision power with a typical response cum correction time of 20 milliseconds to comply with the requirements of the ITIC curve for power supply to electronics.

TSi VRP has revolutionised the industry, as the existing technologies become either obsolete or extremely expensive. Hence, we don't call them our competitors.

They are simply 'wrong solutions' for the existing power problems.

How does the TSi VRP work?

The high frequency Insulated Gate Bipolar Transistor (IGBT) driven converter takes the incoming AC power, measures it against the nominal voltage reference and adds or subtracts voltage to achieve a precisely regulated 230V output. The automatic bypass will be activated when there is a fault condition.

Green LEDs are used to indicate Normal (regulating mode) operation.

Operating Temperature Range	0 to + 45 °C
Operating Humidity Range	10 to 90% relative humidity (non-condensing)
Note: 1. The voltage regulation is based on 400V nominal output voltage. This would proportionately change in case nominal output voltage is required to be preset at any other value between 380V-415V. 2. All standard models are optionally available in IP54.
